FUTURES4FORESTS:

Learning from the past for redefining the trajectory of future forests

META-ANALYSIS OBJECTIVES

- How does vegetation respond to wildfires in Mediterranean-Type Ecosystems?

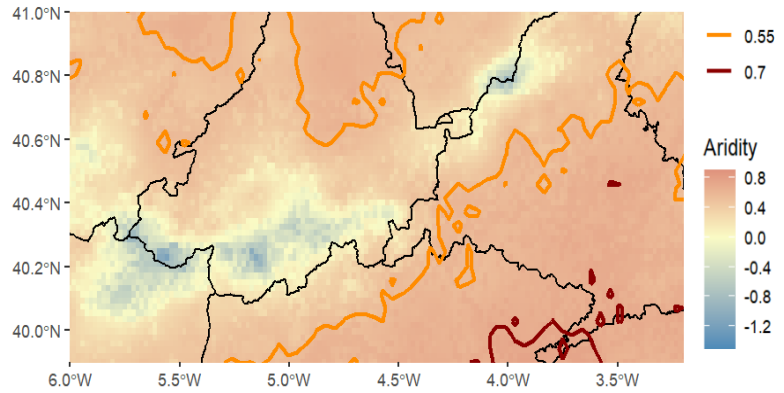

META-ANALYSIS OBJECTIVES

- How does vegetation respond to wildfires in Mediterranean-Type Ecosystems?

- Which variables have been studied as potential drivers of post-fire vegetation regeneration?

- Does post-fire recovery varies along aridity gradients?

SEARCH STRING

ABSTRACT SCRENING

Metagear R package

- C1 - The wildfire originally affects a forest or a plantation.

**We consider forest as any area that includes tree species in the pre-fire stage.*

- C2 - Takes place in a location with a Mediterranean climate.

- C3 - That it be field data (observational studies), excluding simulations/modelling, or data obtained under laboratory conditions or reviews.

- C4 - Studies are included if they assess post-fire vegetation responses.
